DATA SHEET

Valve Electronic Type **CV 261**

RATINGS AND OPERATING CONDITIONS.

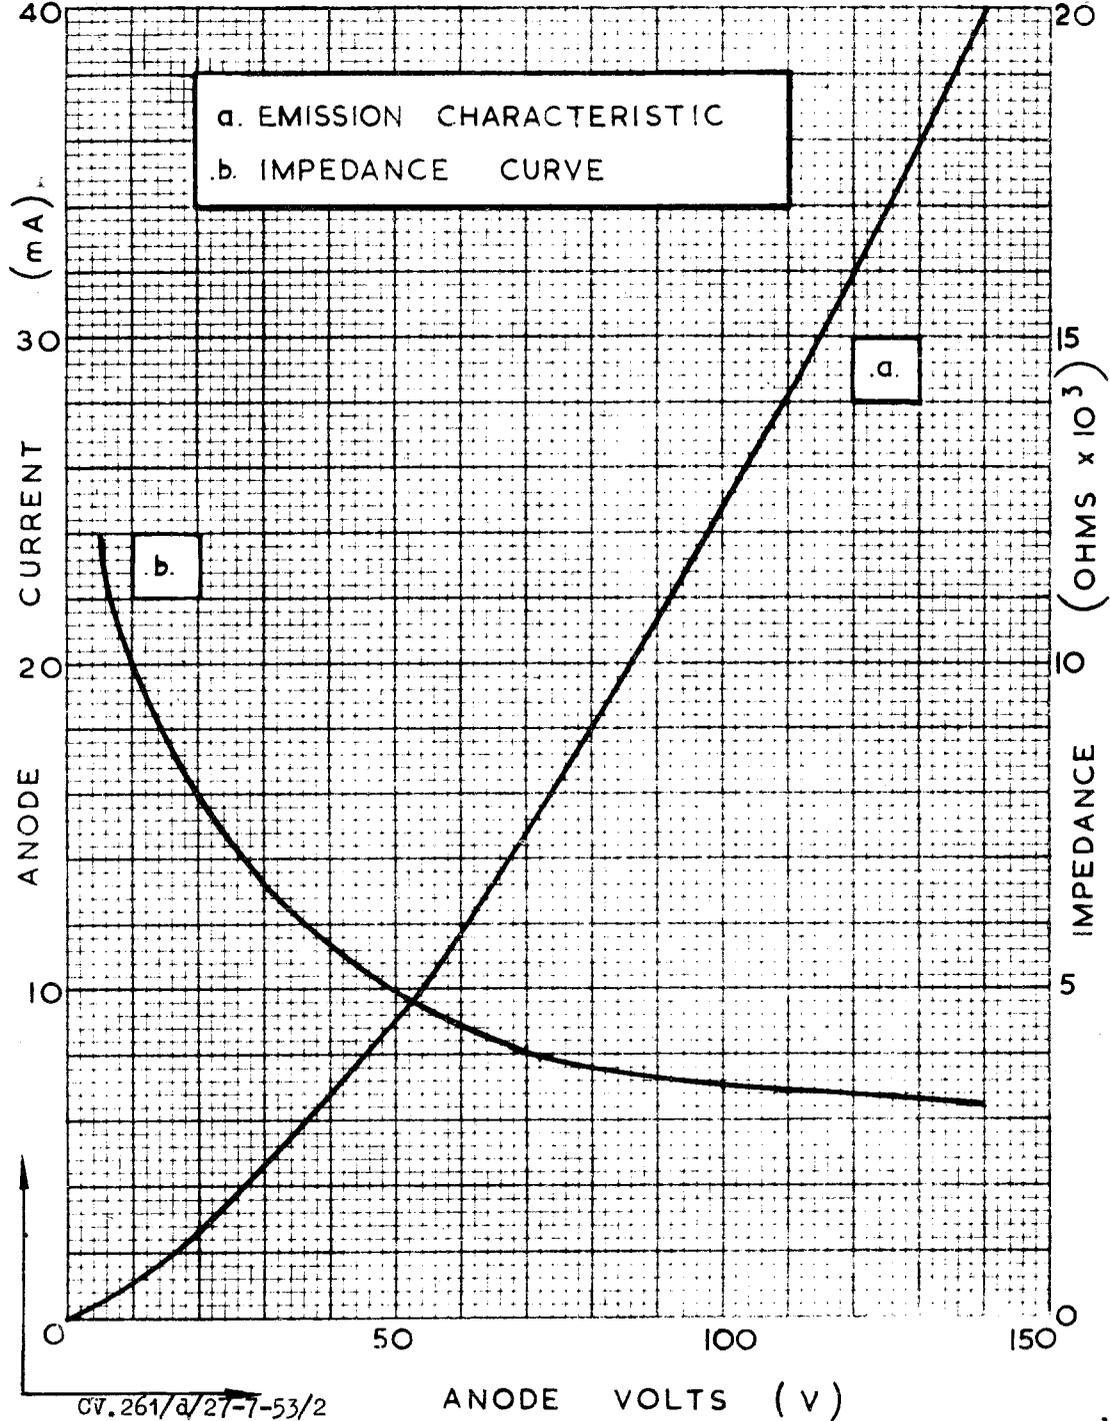

Max. No-load P.I.V.	14.0	kV
" Working P.I.V.	12.5	kV
" Applied Anode Voltage (R.M.S.)	5.0	kV
" Mean D.C. Anode Current	5.0	mA
" Peak Anode Current	40.0	mA
" Heater/Cathode voltage	10.0	Volts
Min. external circuit limiting impedance	50,000	Ohms
Recommended value of reservoir condenser	0.25	μF
H.T. switching delay time (see Note 2)	30.0	secs

Mounting Position - Vertical, base downwards.

Notes

- (1) The above ratings apply for operation at 50 c/s with a condenser input filter.
- (2) When the valve is used under normal conditions, the heater must be switched on for at least 30secs before the application of the Anode Voltage. Simultaneous switching of L.T. and H.T. may be used however when the valve is used at a rating of 3.5 kV/1.5 mA or less.
- (3) The external circuit impedance is the effective transformer impedance and must be increased, if necessary, to the minimum value by the addition of a resistance in the anode circuit.
