REMARK

In general it will be necessary to take measures in order to prevent the maximum permissible screen grid dissipation of the tube that derive their anode voltage from this booster diode, from being exceeded during the heating-up time of the booster diode.

¹⁾ Max. pulse duration 22% of a cycle with a maximum of 18 μ sec.

²⁾ Cathode positive with respect to the anode.

³⁾ R_s = minimum resistance of the heater chain between any heater pin and any mains terminal under working conditions (the heater of another tube can be used for this resistance).
