ADMIRALTY SIGNAL & RADAR ESTABLISHMENT

Specification AD/CV355. Issue No.2.	SECURITY		
Dated 25.2.49.	Specification	Valve	
To be read in conjunction with K1001 ignoring clauses: - 5.2, 5.3, 5.8.	Restricted	Unclassified	

TYPE OF VALVE:- Magnetron, pre-plumb CATHODE:- Indirectly heated, of ENVELOPE:- Copper and glass. PROTOTYPE:- E1541.		MARKING See K1001/4. Additional markings: Serial No See Note B.
RATING Heater Voltage (AC or DC) (V) Heater Current (A) Approx. Nominal Wavelength (cm)	Note 6.3 A 1.3 3.25 B	DIMENSIONS & CONNECTIONS See Drawing, page 3.
Max. Frequency Pulling (Mc/s) Peak Anode Input Power (kW) Duty Cycle	15 C 500 D	PACKAGING
Typical Operating Conditions Peak Anode Voltage (kV) Peak Anode Current (A) Peak Power Output (kW)	25 E 20 E 200 E	See K1005.

NOTES

- A. If the input power is sufficiently high Vh = 6.3 V may be required for starting only and during operations may be reduced or switched off. Wh must be applied for at least 1.5 minutes before Va is applied.
- B. No technical information shall appear on the valve or packing.
- C. For a S.W.R. of 1.5:1.
- D. Peak anode input power limited by cathode dissipation at the stated duty cycle. When switching on, the power should be increased gradually from zero to full input. During operation and testing air must be blown through a suitable fitting on to the radiator fins of the anode, so that the block temperature does not rise above 140°C.
- E. These figures are for pulse operation with :-

Recurrence frequency: 500 pps. : 2,000 pps. : 4,000 pps.

: 1 microsec.: 0.2 microsec.: 0.1 microsec. Pulse length

: Sensibly square. Pulse shape

Field strength : 4,500 oersteds external, 5,500 oersteds

internal.

The valve is required to operate with any field in the range 4500 + 200 cersteds.

TESTS

To be performed in addition to those applicable in K1001.

	Test Con		Test		Limits		No.	
	Vh (V)	Ia (A) peak			Min.	Max.	Tested	Note
a	6.3		Ih	(A)	1.2	1.4	100%	
ъ	6.3 reduced to 0	20	Va peak	(kV)	21	27	100%	1,2, 3,4.
0	A mismatcher to voltage S.W.R. variable phase	of 1.5:1 with shall be used	(i) Frequen	(Mc/s)		9300	100%	1,2,3.
	by a matched t max. frequency	tron, followed ermination. The deviation which phase is changed l be noted.		g (Mc/s)	-	15	100%	
đ	0	20	Efficiency =			2,596023		
	Efficiency is to be measured by an approved method.		Power output Power input (%		35	-	100%	1,2, 3,5.
•	0 10 to 20 A. The frequency is to	Ia peak to be varied from ne change of be observed.	Frequency	(361)	shall	ly and t dis-	Small %	1,2,3.

NOTES

- 1. The valve is to be pulse tested, according to the above table (tests 'b' to 'e') in an approved circuit, and with the following test conditions: -
 - 1.1. Recurrence frequency : 500 pps. or (2000 pps.
 - 1.2. Minimum pulse length: 1 microsec. (0.2 microsec.
 - 1.3. Pulse shape : Sensibly square. 1.4. Field strength : 4500 ± 50 cersteds.
- The cathode lead side of the valve shall be adjacent to the north pole of the magnet.
- During Type Approval the operation of the valve at a field strength of 4300 oersteds and 4700 oersteds should be established.
- 4. The magnetron shall be processed so as to ensure as far as possible that only brief ageing (of the order of 10 minutes or less) is necessary when the power applied is gradually increased from zero to the full input. No serious or continued flashing (internal or external) must occur during the tests.
- 5. The apparatus used for the measurement of output power is to be checked after every 500 valves tested, or once a month (whichever applies first) against the calorimetric method of measurement.
