NOTES

- A. The temperature over the top 15 mm of the bulb to be not greater than 150°C.
- B. Measured on 1Mc/s bridge in fully screened holder. No shield. All I.C. connections left floating.

To be performed in addition to those applicable in K1001 and in the specified order unless otherwise agreed with the Inspecting Authority.

NOTES

1. Valve to be driven with 2μ second pulse at p.r.f. 1000 c.p.s. so that the grid voltage rises to 50V positive, (max) during pulse R.L. to be 2,200 ohms ± 5%.

The load circuit should include some ^{series} ~~source~~ inductance which together with the circuit damping should be chosen so that the peak pulse E.H.T. overshoot is equal to half the load pulse voltage. The E.H.T. storage capacity, fed from a high impedance supply, should be 0.05 μF. Duration of test, 2 minutes. During the second minute the valve shall be sensibly free from flashing as shown by disturbance of the current waveform displayed on an oscilloscope.

2. Tp 2 μsecs p.r.f. 50 c/s.

3. Valves to be vibrated in each of the three required planes for not less than 30 hrs. and not less than 100 hrs. total. Heater switched 1 min. on 3 mins. off. No other voltages applied. Min peak acceleration = 5g. Frequency = 170 c/s.

4. Va (b) = 250V Rk = 270 ohms.
Vg2(b) = 250V Ck = 1000 μF.
RL = 2 Kohms. Cc = 0.1 μF.
Rg2 = 15 Kohms. g = 2.5

First Line: Delete "source", Insert "series".

Fourth line: Between "supply" and "should" insert the following:-
"giving a short circuit current not greater than
40mA."

Sixth line: Delete: "Sensibly".
