For Color Television Film Pickup Service

- Electrostatic-Focus, Magnetic-Deflection
- Low-Power "Dark Heater" — 0.6 Watt
- Separate Mesh Connection
- Precision Outer-Diameter Glass Bulb
- Tested to Stringent Signal Uniformity Specifications

General Data
Dimensions ................. See Dimensional Outline
Direct Interelectrode Capacitance\(^a\):
  Target to all other electrodes .......... 5 \( \text{pF} \)
Focusing Method ................. Electrostatic
Deflection Method ................. Magnetic
Heater Power ..................... 0.6 \( \text{W} \)
Maximum Useful .................. 0.375 \( \times \) 0.5 \( \text{in} \)
  Picture Size ..................... (12.70 \( \times \) 9.52 mm)
Orientation of Quality Rectangle:
  Proper orientation
  is obtained when the horizontal scan
  is essentially parallel to the
  straight sides of the masked portions
  of the faceplate. The straight sides
  are parallel to the plane passing
  through the tubes and short
  axis index pin.
Base ................. Small-Button Ditetrar 8-Pin (JEDEC No. E8-11)\(^b\)
Socket ................. Cinch\(^b\)
  No. 133-98-11-015,
or equivalent
Weight ..................... 2.8 (79.5 g) \( \text{oz} \)
Operating Position ............. Any
Deflection Alignment Assembly\(^c\) Cleveland
Electronics No.
VYA-300, or equivalent
Maximum Ratings, Absolute-Maximum Values:

- Grid-No.6 & 3 Voltage \(e\) \(=\) 1350 V
- Grid-No.5 Voltage \(=\) 1000 V
- Grid-No.4 Voltage \(=\) 400 V
- Grid-No.2 Voltage \(f\) \(=\) 850 V
- Grid-No.1 Voltage:
  - Negative bias value \(=\) 300 V
  - Positive bias value \(=\) 0 V
- Peak Heater-Cathode Voltage:
  - Heater negative with respect to cathode \(=\) 125 V
  - Heater positive with respect to cathode \(=\) 10 V
- Heater Voltage \(=\) 6.3 ± 5% V
- Target Voltage \(=\) 125 V
- Target Dark Current \(=\) 0.20 \(\mu\)A
- Peak Target Current \(g\) \(=\) 0.60 \(\mu\)A
- Faceplate:
  - Illumination \(h\) \(=\) 5000 fc
  - Temperature \(=\) 71 \(^\circ\)C

Typical Operation and Performance Data

- Grid-No.6 (Decelerator) & 3 Voltage \(e\) \(=\) 750 V
- Grid-No.5 Voltage \(e\) \(=\) 325 to 450 V
- Grid-No.4 (Beam-Focus Electrode) Voltage \(=\) 90 to 150 V
- Grid-No.2 (Accelerator) Voltage \(f\) \(=\) 300 V
- Grid-No.1 Voltage (For Picture Cutoff) \(i\) \(=\) −45 to −100 V
- Signal-To-Noise Ratio (Approximate) \(m\) \(=\) 300:1
- Typical Resolution:
  - Center \(=\) 700 TV Lines
Limiting Resolution:
  Center horizontal ................. 500 (min.)  TV Lines
  Center vertical ................. 400 (min.)  TV Lines

Amplitude Response to 400
  TV Line Square-Wave Test
  Pattern at Center of Picture\textsuperscript{t} ... 30 \%

Average "Gamma" of Transfer
  Characteristic .................. 0.65

Lag-Per Cent of
  Initial Value of Signal-Output Current
  1/20 Second after Illumination is Removed\textsuperscript{n} .......... 20 \%

Typical Sensitivity
  Faceplate Illumination ............ 4 \(\text{fc}\)
  Target Voltage\(p,q\) ............ 15 to 30 \(\text{V}\)
  Dark Current\(q,r\) ............ 0.010 \(\mu\text{A}\)
  Signal Output Current
    (Typical)\(s\) ............ 0.30 \(\mu\text{A}\)

Notes

a  This capacitance, which effectively is the output impedance of the vidicon, is increased when the tube is mounted in the deflecting-yoke assembly. The resistive component of the output impedance is in order of 100 megohms.

b  Made by Alden Products Co., 9140 North Main St., Brockton 64, Massachusetts.

b'  Made by Cinch Manufacturing Co., 1026 S. Homan Ave., Chicago 24, Illinois.

c  Made by Cleveland Electronics Inc., 2000 Highland Road, Twinsburg, Ohio 44087.

e  Grid-No.6 & 3 voltage must always be greater than grid-No.5 voltage. The maximum voltage difference between these electrodes, however, should not exceed 800 volts. The recommended ratio of grid-No.5 to grid-No.6 & 3 voltage is 6/10 to 5/10; best geometry being provided when the ratio is 6/10, and most uniform signal output when the ratio is 5/10. The operator should select the ratio within this range which provides the desired performance.
The power dissipation at grid No.2 should not exceed one watt, a condition normally met when the tube is operated at the specified maximum grid-No.2 rating and when the specified peak target current rating is not exceeded. However, if the vidicon is operated continuously with grid-No.1 voltage near or approaching zero bias, grid-No.2 voltage should not exceed 350 volts dc maximum.

Video amplifiers must be designed properly to handle target currents of this magnitude to avoid amplifier overload or picture distortion.

For condition where "white light" is uniformly diffused over entire tube face.

With no blanking voltage on grid No.1.

Measured with high-gain, low-noise, cascode-input-type amplifier having bandwidth of 5 MHz and a peak signal-output current of 0.35 microampere. Because the noise in such a system is predominately of the high-frequency type, the visual equivalent signal-to-noise ratio is taken as the ratio of the highlight video-signal current to rms noise current, multiplied by a factor of 3.

For initial signal-output current of 0.2 microampere and a dark current of 0.02 microampere.

Indicated range for each type of service serves only to illustrate the operating target-voltage range normally encountered.

The target voltage for each vidicon must be adjusted to that value which gives the desired operating dark current.

The deflecting circuits must provide extremely linear scanning for good black-level reproduction. Dark-current signal is proportional to the scanning velocity. Any change in scanning velocity produces a black-level error in direct proportion to the change in scanning velocity.

Defined as the component of the highlight target current after the dark-current component has been subtracted.

This typical capability may be limited by conditions external to the tube such as test pattern material, optics and/or yoke.

Dimensions are in inches unless otherwise stated. Dimensions in parentheses are in millimeters and are derived from the basic inch dimensions (1 inch = 25.4 mm).

**Note 1** — Straight sides of masked portions are parallel to the plane passing through tube axis and short index pin.

**Note 2** — Within this distance, diameter of bulb is $1.025'' + 0.003'' - 0.030''$. Tube is acceptable regarding camber when it can be inserted into a $1''$-long cylinder gauge which has an inner diameter of $1.0280'' + 0.0011'' - 0.0000''$. The gauge must pass along the tube length from the base to the metal target flange.

**Note 3** — Faceplate is Corning No.7056 glass having a thickness of $0.094'' \pm 0.012''$.
