RCA-6201 is a high-mu twin triode of the heater-cathode type. It is intended for use in a wide variety of applications including mixers, oscillators, and amplifiers at frequencies up to 300 megacycles, multivibrators, synchronizing amplifiers, and numerous critical industrial control devices. Constructed to give dependable performance under conditions of shock and vibration, this "premium" version of the 12AT7 is especially suited for use in mobile and aircraft equipment.

In the 6201, special attention has been given to structural features which improve its strength for resistance to both shock and vibration. These features include a special "U"-frame construction to keep the mount rigid, and special tube parts which are precisely made and accurately fitted to lock the parts firmly in place and thus eliminate variations in electrical characteristics. Other features include grid rods having high heat conductivity to provide cool operation thereby minimizing grid emission, a pure-tungsten heater having high mechanical strength to give long life under conditions of frequent on-off switching, and a special getter shield to prevent deposit of getter flash on tube elements. Furthermore, the 6201 is controlled for cathode interface to insure dependable performance in "on-off" control applications involving long periods of operation under cutoff conditions. These features in addition to rigid controls and rigorous tests to insure "premium" quality, make this tube especially useful in critical industrial applications.

The 6201 utilizes separate terminals for each cathode to permit flexibility of circuit arrangement, and a mid-tapped heater to permit operation from either a 6.3- or a 12.6-volt supply.

**GENERAL DATA**

**Electrical:**
- Heater for Unipotential Cathodes:
  - Heater Arrangement: Series
  - Voltage (AC or DC): 12.6 volts
  - Current: 0.15 amp

**Direct Interelectrode Capacitances: Grid-Drive Service**

**Mechanical:**
- Mounting Position: Any
- Maximum Overall Length: 2-3/16"
- Maximum Seat Length: 1-15/16"
- Length from Base Seat to Bulb Top (Excluding tip): 1-9/16" + 3/32"
- Maximum Diameter: 7/8" Bulb
- Base: "Small-Button Nodal 9-Fin" (JETION No.69-1)

**AMPLIFIER—Class A1**

**Values are for Each Unit**
- Maximum Ratings, Absolute Values:
  - PLATE VOLTAGE: 330 max. volts
  - GRID VOLTAGE:
    - Negative bias value: 55 max. volts
    - Positive bias value: 0 max. volts
  - PLATE DISSIPATION: 2.75 max. watts
  - PEAK HEATER-CATHODE VOLTAGE:
    - Heater negative with respect to cathode: 100 max. volts
    - Heater positive with respect to cathode: 100 max. volts
  - BULB TEMPERATURE (at hottest point on bulb surface): 180 max. °C

**Characteristics:**
- Plate Supply Voltage: 100 250 volts
- Cathode-Bias Resistor: 270 200 ohms
- Amplification Factor: 57 60
- Plate Resistance (Approx.): 14300 10900 ohms
Transconductance .......... 4000 5500 µhos
Grid voltage (approx.) for plate current of 10 µamp .......... -5 -12 volts
Plate Current .......... 3.3 10 ma

Maximum Circuit Values:
Grid-Circuit Resistance:
For fixed bias operation .......... 0.25 max. megohm
For cathode-bias operation .......... 1 max. megohm

*With external shield, JETEC No.315, connected to cathode of unit under test.

*At 2 volts (RMS) output
Note: Coupling capacitors should be selected to give desired frequency response. Cathode resistors should be adequately bypassed.

CHARACTERISTICS RANGE VALUES FOR EQUIPMENT DESIGN

Values are for each unit and are initial, unless otherwise specified.

Heater Current .......... 1 0.138 0.162 amp
Direct Interelectrode Capacitances:
Grid to plate .......... 2 1.3 1.9 µµf
Grid to cathode and heater .......... 2 2 3 µµf
Plate to cathode and heater (Unit No.1) .......... 2 0.2 0.7 µµf
Plate to cathode and heater (Unit No.2) .......... 2 0.16 0.6 µµf
Heater to cathode .......... 2 2.1 3.5 µµf
Plate to plate .......... 3 0.15 0.39 µµf
Amplification Factor .......... 1.4 50 70
Plate Current (1) .......... 1.4 7 14 ma
Plate-Current Difference Between Units .......... 1.4 - 3.2 ma
Plate Current (2) .......... 1.5 - 100 µµamp
Transconductance (1) .......... 1.4 3800 6500 µµhos
Transconductance (1) at 500 Hours .......... 1.4 3800 6500 µµhos
Transconductance (2) .......... 3.6 4100 - µµhos

Transconductance Change:
Difference average transconductance (1) initially, and average after 500 hours, expressed as a percentage of the initial average .......... 1.4 - 15 per cent
Reverse Grid Current .......... 1.7 - 0.7 µµamp
Grid Emission Current .......... 7.9 - 1.5 µµamp
Heater-Cathode Leakage Current:
Heater negative with respect to cathode .......... 1.10 - 10 µµamp
Heater positive with respect to cathode .......... 1.10 - 10 µµamp
Leakage Resistance:
Between grid and all other electrodes tied together .......... 1.11 100 - megohms
Between plate and all other electrodes tied together .......... 1.12 100 - megohms

Note 1: With 12.6 volts ac or dc on heater (series connection).
Note 2: With no external shield and electrodes of unit not under test grounded.
Note 3: With no external shield.
Note 4: With dc plate-supply voltage of 250 volts, plate load resistor of 200 ohms, and plate bypass capacitor of 1000 µµf. Each unit is tested separately. Electrodes of units not under test are grounded.
Note 5: With dc plate-supply voltage of 250 volts, plate load resistance of 0.1 megohm, and dc grid voltage of -20 volts. Each unit is tested separately. Electrodes of unit not under test are grounded.
Note 6: With 11.0 volts ac or dc on heater (series connection).
Note 7: With dc plate-supply voltage of 250 volts, grid resistor of 0.5 megohm, cathode resistor of 200 ohms, and cathode bypass capacitor of 1000 µµf. Each unit is tested separately. Electrodes of unit not under test are grounded.
Note 8: With 15.0 volts ac or dc on heater (series connection).
Note 9: With dc plate-supply voltage of 250 volts, grid resistor of 0.5 megohm, and dc grid voltage of -20 volts. Each unit is tested separately.
Note 10: With 100 volts dc between heater and cathode and units connected in parallel.
Note 11: With grid 100 volts negative with respect to all other electrodes tied together.
Note 12: With plate 300 volts negative with respect to all other electrodes tied together.

*Each tube is stabilized before characteristics testing by continuous operation for at least 45 hours at room temperature and with dissipation values equivalent to life test conditions.
SPECIAL RATINGS AND PERFORMANCE DATA

Shock Rating:

Impact Acceleration: 600 max. g

This test is performed on a sample lot of tubes from each production run in a Navy Type, High-Impact (fly-weight) Shock Machine. Tubes are held rigid in four different positions and are subjected to 20 blows at the specified maximum impact acceleration. At the end of this test, tubes will not show permanent or temporary shorts or open circuits, and are required to meet established limits for vibrational acceleration, heater-cathode leakage current, and transconductance.

Fatigue Rating:

Vibrational Acceleration: 2.5 max. g

This test is performed on a sample lot of tubes from each production run. Tubes are rigidly mounted and subjected in each of three positions to 2.5 g vibrational acceleration at 25 cycles per second for 32 hours. At the end of this test, tubes will not show permanent or temporary shorts or open circuits, and are required to meet established limits for impact acceleration, heater-cathode leakage current, and transconductance.

Low-Frequency Vibration Performance:

RMS Output Voltage: 100 max. mv

This test is performed on a sample lot of tubes from each production run under the following conditions: Plate of unit No. 1 tied to plate of unit No. 2 and grid of unit No. 1 tied to grid of unit No. 2; heater voltage of 12.6 volts, DC plate voltage of 250 volts, DC grid voltage of −3 volts, plate load resistance of 2000 ohms, and vibrational acceleration of 2.5 g at 25 cps.

Heater-Cycling Life Performance:

Cycles of Intermittent Operation: 2000 min. cycles

Under the following conditions and with heaters of unit No. 1 and unit No. 2 connected in parallel: Heater voltage of 7.5 volts cycled one minute on and one minute off, heater 135 volts positive with respect to cathode, and plate and grid voltage = 0 volts.

Audio-Frequency Noise and Microphonic Performance:

RMS Output Voltage: 100 max. mv

This test is performed on a sample lot of tubes from each production run under the following conditions: Plate of unit No. 1 tied to plate of unit No. 2, grid of unit No. 1 tied to grid of unit No. 2; heater voltage of 12.6 volts DC, plate-supply voltage of 300 volts, cathode-bias resistor of 200 ohms common to both units, and plate load resistance of 10000 ohms.

Shorts and Continuity Test:

This test is performed on a sample lot of tubes from each production run. In this test a tube is considered inoperative if it shows a permanent or temporary short or open circuit, or a value of reverse grid current in excess of 1.4 microamperes under the conditions specified in the CHARACTERISTICS RANGE VALUES for reverse grid current.

1-Hour Stability Life Performance:

This test is performed on a sample lot of tubes from each production run to ensure that the tubes have been properly stabilized. With both units operating, each unit is checked for variation in transconductance under conditions of maximum rated plate dissipation to ensure a low percentage of early inoperatives. At the end of 100 hours, a tube is considered inoperative if it shows a permanent or temporary short or open circuit, or a value of reverse grid current in excess of 1.4 microamperes under the conditions specified in CHARACTERISTICS RANGE VALUES for reverse grid current.

100-Hour Life Performance:

This test is performed on a sample lot of tubes from each production run under conditions of maximum rated plate dissipation to ensure a low percentage of early inoperatives. At the end of 100 hours, a tube is considered inoperative if it shows a permanent or temporary short or open circuit, or a value of reverse grid current in excess of 1.4 microamperes under the conditions specified in CHARACTERISTICS RANGE VALUES for reverse grid current.

500-Hour Average Life Performance:

This 500-hour test is made on a sample lot of tubes from each production run to ensure high quality of the individual tube and to guard against epidemic failures of any of the characteristics indicated below. With both units operating, each unit is life tested separately at room temperature under the following conditions: Plate of unit No. 1 tied to plate of unit No. 2, grid of unit No. 1 tied to grid of unit No. 2; heater voltage of 12.6 volts DC, plate-supply voltage of 300 volts, cathode resistor of 200 ohms, grid-No. 1 resistor of 0.5 megohm, grid-No. 2 resistor of 3.5 megohms, heater 135 volts (heater positive with respect to cathode), and bulb temperature of 180°C. At the end of 500 hours, tube will not show permanent shorts or open circuits and will be criticized for the total number of defects in the sample lot and for the number of tubes failing to pass the established initial limits of heater current, reverse grid current, heater-cathode leakage current, and 500-hour limits for transconductance, change, and Leakage Resistance as shown under CHARACTERISTICS RANGE VALUES.

OPERATING CONSIDERATIONS

The maximum ratings in the tabulated data for the 6201 are limiting values above which the serviceability of the 6201 may be impaired from the viewpoint of life and satisfactory performance. Therefore, in order not to exceed these absolute ratings, the equipment designer has the responsibility of determining an average design value for each rating below the absolute value of that rating by an amount such that the absolute values will never be exceeded under any usual conditions of supply-voltage variation, load variation, or manufacturing variation in the equipment itself.

Devices and arrangements shown or described herein may use patents of RCA or others. Information contained herein is furnished without responsibility by RCA for its use and without prejudice to RCA's patent rights.
