The EIMAC 592/3-200A3 is a medium-mu power triode having a maximum plate dissipation rating of 200 watts, and it is intended for use as a power amplifier, oscillator, or modulator. It can be used at its maximum ratings at frequencies as high as 150 MHz.

Cooling of the 592/3-200A3 is accomplished by radiation from the plate, which operates at a visible red color at maximum plate dissipation, and by means of forced-air circulation around the envelope.

**GENERAL CHARACTERISTICS**

Filament: Thoriated Tungsten
- Voltage: 10.0 volts
- Current: 5.0 amperes

Amplification Factor (Average): 25

Direct Interelectrode Capacitances (Average):
- Grid-Plate: 3.3 µf
- Grid-Filament: 3.6 µf
- Plate-Filament: 0.29 µf

Transconductance (Ig=200 ma, Eb=3000 v.): 3600 µmbos

Frequency for Maximum Ratings: 150 MHz

**MECHANICAL**

Mounting: Vertical
- Length: 6.0 inches
- Diameter: 3½ inches
- Net Weight (approx.): 6 ounces
- Shipping Weight (approx.): 1½ pounds
- Cooling: Radiation and Forced-Air

Recommended Heat Dissipating Connectors:
- Plate: EIMAC HR-10
- Grid: EIMAC HR-5

Maximum Bulb Temperature: 225°C

Maximum Seal Temperature: 175°C

**AUDIO FREQUENCY POWER AMPLIFIER AND MODULATOR**

Class B

**TYPICAL OPERATION**

- Sinusoidal wave, two tubes unless otherwise specified.
- DC Grid Voltage (approx.):
  - Voltage (per tube): 260, 270, 270 Volts
  - Max-Signal Peak Driving Power: 50, 52, 40 Watts
  - Max-Signal Nominal: 25, 26, 20 Watts
  - Max-Signal Plate Power Output: 600, 725, 820 Watts

- Adjust to give stated zero-signal plate current.

**PLATE MODULATED RADIO FREQUENCY AMPLIFIER**

Class-C Telephonic (Carrier conditions, per tube)

Plate Power Output - - 300 370 466 600 Watts

Plate Voltage — Except for special applications, the plate supply voltage for the 592/3-200A3 should not exceed 3500 volts. In most cases there is little advantage in using plate-supply voltages in excess of those given under “Typical Operation” for the power output desired.

Plate Dissipation — Under normal operating conditions, the power dissipated by the plate of the 592/3-200A3 should not exceed 200 watts. At this dissipation the brightness temperature of the plate will appear a red-orange in color. The value of this color is somewhat affected by light from the filament, as well as from external sources. Plate dissipation in excess of the maximum rating is permissible for short periods of time, such as during tuning procedures.

MECHANICAL
Mounting — The 592/3-200A3 must be mounted vertically, base down or base up. Flexible connecting straps should be provided from the grid and plate terminals to the external grid and plate circuits. The tube must be protected from severe vibration and shock.

Cooling — An air-flow of approximately 15 cubic feet per minute should be directed at the bulb from a 2 inch diameter nozzle located about three inches from the center line of the tube. The center line of the nozzle should be located about two inches down from the top of the plate terminal. The incoming air temperature should not exceed 50°C. Other methods of cooling may be used provided the maximum bulb and seal temperatures are not exceeded. An 8 inch, household-type fan located about 10 inches from the tube is one alternate method. Special heat-dissipating connectors EIMAC HR-5 and HR-10, or equivalent, for grid and plate terminals respectively) should be used with this tube. These connectors help to prolong tube life by reducing the temperature of the metal-glass seals.

ELECTRICAL
Filament Voltage — For maximum tube life, the filament voltage, as measured directly at the filament pins, should be the rated value of 10.0 volts. Unavoidable variations in filament voltage must be kept within the range of 9.5 to 10.5 volts.

Bias Voltage — There is little advantage in using bias voltages in excess of those given under “Typical Operation” except in certain very specialized applications. Where bias is obtained by a grid leak, suitable protective means must be provided to prevent excessive plate dissipation in the event of loss of excitation.

Grid Dissipation — The power dissipated by the grid of the 592/3-200A3 must not exceed 25 watts. Grid dissipation may be calculated from the following expression:

\[ P_g = e_{cp} I_g \]

where \( P_g \) = grid dissipation,

\( e_{cp} \) = peak positive grid voltage, and

\( I_g \) = dc grid current.

\( e_{cp} \) may be measured by means of a suitable peak-reading voltmeter connected between filament and grid.
DRIVING POWER vs. POWER OUTPUT

The four charts on this page show the relationship of plate efficiency, power output and grid driving power at plate voltages of 2000, 2500, 3000 and 3500 volts. These charts show combined grid and bias losses only. The driving power and power output figures do not include circuit losses. The plate dissipation in watts is indicated by $P_p$.

Points A, B, C, and D are identical to the typical Class C operating conditions shown on the first page under 2000, 2500, 3000, and 3500 volts respectively.
