Compactron Triple Triode

The 9AK10 is a compactron containing three high-mu triodes. It is designed primarily for service as a color-difference amplifier in color television receivers and is particularly suited for use with solid-state demodulators. Except for heater characteristics and ratings, the 9AK10 is identical to the 5AK10.

**GENERAL**

**ELECTRICAL**
Cathode - Coated Unipotential
Heater Characteristics and Ratings
Heater Voltage, AC or DC*: ......................................................... 9.5 Volts
Heater Current*: ..................................................................... 0.6 ± 0.04 Amperes
Heater Warm-up Time, average*: ............................................. 11 Seconds

**NOTES**

* Heater voltage for a bogey tube at I<sub>f</sub> = 0.6 amperes.
* The equipment designer should design the equipment so that heater current is centered at the specified bogey value, with heater supply variations restricted to maintain heater current within the specified tolerance.
* The time required for the voltage across the heater to reach 80 percent of the bogey value after applying 4 times the bogey heater voltage to a circuit consisting of the tube heater in series with a resistance equal to 3 times the bogey heater voltage divided by the bogey heater current.
