COLOUR PICTURE TUBE
HELIUCHROM
with integrated neck components
semitoroid

A51-210X
A51-211X

Tube base
JEDEC B 12-262

Tube base
JEDEC B 12-260

Unused pegs must not be connected

Tube

51 cm (20") screen diagonal
90° deflection angle
Extremely rectangular
Sides approx. 30 x 40 cm
Screen area approx. 1190 cm²
Neck diameter 29 mm
Quick heating cathode
No convergence correction necessary
Neck components optimally adjusted - solidly mounted
Slotted mask; striped screen
Inline gun
Internal magnetic shielding (supplemented by external degaussing)
Faceplate filter glass, light transmission approx. 70 %
Heliochrom offers a higher brightness at same contrast ratio.
Implosion protected (tension band)
Push-through presentation
Weight approx. 12,3 kg

Deflection yoke

Toroidal winding vertical and saddle winding horizontal
The deflection yoke is adjusted and set during manufacture for optimum dynamic convergence, colour and white purity.

Multi-pole unit

A permanently magnetised ring pair for colour purity.
Two permanently magnetised ring pairs for static convergence.
The multi-pole unit is adjusted during manufacture for optimum colour and white purity and for static convergence.
### Maximum Ratings

**Heater voltage** \( U_f \)  
Optimum cathode life time is achieved by stabilization of the heater voltage at 6.3 V. Continued over or under heating by 0.2 V is harmless. The absolute maximum rating is ±10%, but may only be applied for short periods whereby the long-term average value should be ±0.2 V.

- **Anode voltage** \( U_a \) max: 27.5 kV  
  \( U_a \) min: 20 kV  
- **Anode current** \( I_a \) max: 1.0 mA  
- **Focusing voltage** \( U_{g3} \) max: 6 kV  
- **Screen grid voltage** \( U_{g2} \) p max: 1 kV  
- **Peak voltage between cathode and grid No. 1** \((-U_k)_p max\) \( U_k \) p max: 2 V  
  \((-U_k)_{max}\) \( U_k \) max: 400 V  
- **Voltage between cathode and grid No. 1** \((-U_k)_p max\) \( U_k \) max: 200 V  
- **Peak voltage between cathode and heater** \( U_{-fk} \) p max: 200 V  
  \( U_{+fk} \) p max: 200 V  
- **Voltage between cathode and heater** \( U_{-fk} \) max: 450 V  
  \( U_{-fk} \) max: 200 V  
  \( U_{+fk} \) max: 0 V

*During warm-up period of max. 15 sec. the voltage between cathode and heater may increase to max. 450 V. Between 15 and 45 seconds after switch-on the voltage must decrease proportionally with time to max. 200 V

**Shock acceleration during transport and handling** max: 350 m/s²
Typical operating conditions

Unless otherwise stated, the following conditions apply:

1. Heater voltage $U_f = 6.3$ V

2. All voltages are referenced to grid No. 1

3. Voltage of grid No. 2 is equal to that of the measured grid No. 2 cutoff voltage.

4. Voltage of grid No. 3 is set for optimum sharpness of definition.

5. The colour coordinates for white are: $x = 0.313$; $y = 0.329$

Dot-shaped screen and glass faults

Zone A refers to the central field of 213 x 165 mm.

Zone B refers to the remain screen area.

Observation of the fault through grey filters with densities of 0.7 and 1.3 from a distance of min. 60 cm.

High contrast:  
The visibility of the fault is maintained between change from 0.7 to 1.3 filter.

Medium contrast:  
The fault disappears between change from 0.7 to 1.3 filter.

For non-circular faults, the equivalent fault size is: Length plus width divided by two.

Missing or non-illuminating phosphor dots are evaluated as for dot-shaped faults.
Permissible are:

<table>
<thead>
<tr>

</table>

The sum of the lengths of all scratches with widths from 0.05 to 0.15 mm is max. 180 mm.

General

For stand-by heating, a heater voltage of 4.5 to 5 V is recommended.

To reduce the possibility of damage to the tube or circuit by internal high voltage flashovers, spark gaps should be used and the connection with the external conductive coating should be made using the shortest possible leads.

The connection to the external conductive coating should be made over a large surface area.

In order to conserve the optimal factory adjustments of the colour purity and convergence, it is necessary to degauss the tube completely.

During transport and handling of the tube, the neck components must not be mechanically strained. Even slight changes of positioning or adjustments, also deformation of the coils, can have a large effect on colour purity and convergence.

*Recommendation for degaussing in separate description.

Date: 1978-08-14
Notes (dimensional drawing)

1. Anode cavity 7.92 according to the German Industrial Standard DIN 41543 (JEDEC No. J 1 - 21)

3. This area is free of external conductive coating and must be kept clean.

4. The tube base will fall within a tolerance circle of max. 55 mm diameter, with respect to the tube axis. The socket should not be rigidly mounted but must be connected by flexible leads.

5. Nominal dimensions of the mounting bolts. For the bolts a free passage of at least 8.5 mm diameter is guaranteed in normal mounting position.

6. Dimensions of the bulb, measured at the front edge of the implosion protection.

7. The maximum deviation between one screenside angle-seating and a plane through the other three angle-seatings will not exceed 2 mm.

8. The Z points are reference points for the vertical position of the X and Y points. The dimensions for the position of the X, Y and Z points also apply to the border line of the minimum useful screen area.

11. The outer limitation of the mounting lugs lies within these maximal dimensions.

15. Mounting holes for degaussing coils.

20. Tension band and external coating are galvanically separated from each other. They may be connected mutually if it is allowed by the effective safety rules. The impedance between tension band and the external coating must not exceed 1 MΩ at 50 Hz and 5 kΩ at 15 kHz.

21. The external conductive coating of the tube must be connected with the negative high voltage terminal.

22. Minimum useful screen area.

23. Bare metal on all sides.

24. This space is to be kept free of other magnetic material in order to reduce negative effects on the tube properties (convergence, incorrect beam landing).

25. Frit seal.
