* With heater negative. Cathode should be connected to the mid-tap or to one side of the heater transformer winding.

** Brilliance and definition decrease with decreasing anode No. 2 voltage. In general, anode No. 2 voltage should not be less than 1500 volts.

*** Individual tubes may require between +20% and -35% of these values with grid voltage between zero and cut-off.

# Visual extinction of stationary focused spot.

## Volts/volt for unit circle diameter in mm. Since deflection sensitivity is inversely proportional to circle diameter, sensitivity for any desired circle diameter is unit value/D(in mm).

### Volts D.C./inch for unit circle diameter in inches. Since deflection factor is directly proportional to circle diameter, deflection factor for any desired circle diameter is unit value x D(in inches).

SPOT POSITION

The undeflected focused spot will fall within a 15-mm square centered at the geometric center of the tube face and having one side parallel with the trace produced by DJ1 and DJ2.

Suitable test conditions are: anode No. 2 voltage, 2000 volts; anode No. 1 voltage, adjusted for focus; deflecting electrode resistors, 1 megohm each, connected to anode No. 2; the tube shielded from all extraneous fields. To avoid damage to the tube, make the test with grid voltage near cut-off.

BASING and DEFLECTING ELECTRODE ALIGNMENT

The angle between the trace produced by DJ1 and DJ2 and its intersection with the plane through the tube axis and pin No. 5 will not exceed 10°.

The angle between the trace produced by DJ1 and DJ2 and the trace produced by DJ3 and DJ4 will be 90° ±4°.

With DJ1 (pin 11) positive with respect to DJ2 (pin 10), the spot will be deflected toward pin 5; likewise, with DJ3 (pin 7) positive with respect to DJ4 (pin 8), the spot will be deflected toward pin 2.
